BETTING STRATEGIES BY THE NUMBERS · 02 / 11

PAROLI

STRATEGY BY THE NUMBERS

1 → 2 → 4 DOUBLE AFTER A WIN, STOP AFTER THREE

The reverse Martingale: you raise the stake only with money you have just won. Small risk per cycle, rare big wins. Checked on 10,000 simulated bettors.

30.0%	0.0%	4.0
ENDED IN PROFIT	WENT BUST	LOST PER 100 STAKED

STATSAI.BET

BEFORE YOU TRY PAROLI

PAROLI RISKS LITTLE PER CYCLE. THE QUESTION IS HOW OFTEN THREE WINS IN A ROW REALLY HAPPEN.

Every strategy in this series stands or falls on two numbers: the real chance and the odds. StatsAI.bet shows both for today's matches. Create an account in one click with Google or Telegram and use every tool free for the first 7 days. After the trial a free basic level remains.

01

HOW THE PAROLI WORKS

Paroli turns the Martingale upside down. After a win you double the stake, after a loss you go back to the base stake. After three wins in a row you take the profit and start again.

01	02	03	04	05
BET 1	**WIN**	**WIN AGAIN**	**THIRD WIN**	**ANY LOSS**
base stake, e.g. 10	double: 20	double: 40	+70, back to 10	back to 10

AT A GLANCE

TYPE
positive progression

BUILT FOR
odds around 2.00

GOAL
+7 base stakes per full cycle

MAIN DANGER
three wins in a row are rare

The appeal is clear: the bigger stakes are paid with money you have just won, so one cycle can never cost you more than one base stake. A full cycle of three wins turns 10 into **+70**.

The catch is in the word **three**. At a 48% chance per bet, three wins in a row happen only 11.1% of the time. In all the other cycles you lose exactly one base stake.

WHERE THE NAME COMES FROM

"Paroli" comes from the Italian card game basset, played in the 16th and 17th centuries, where letting a winning stake ride on the next card was called a paroli. The same idea lives on in roulette and in betting as the reverse or anti-Martingale.

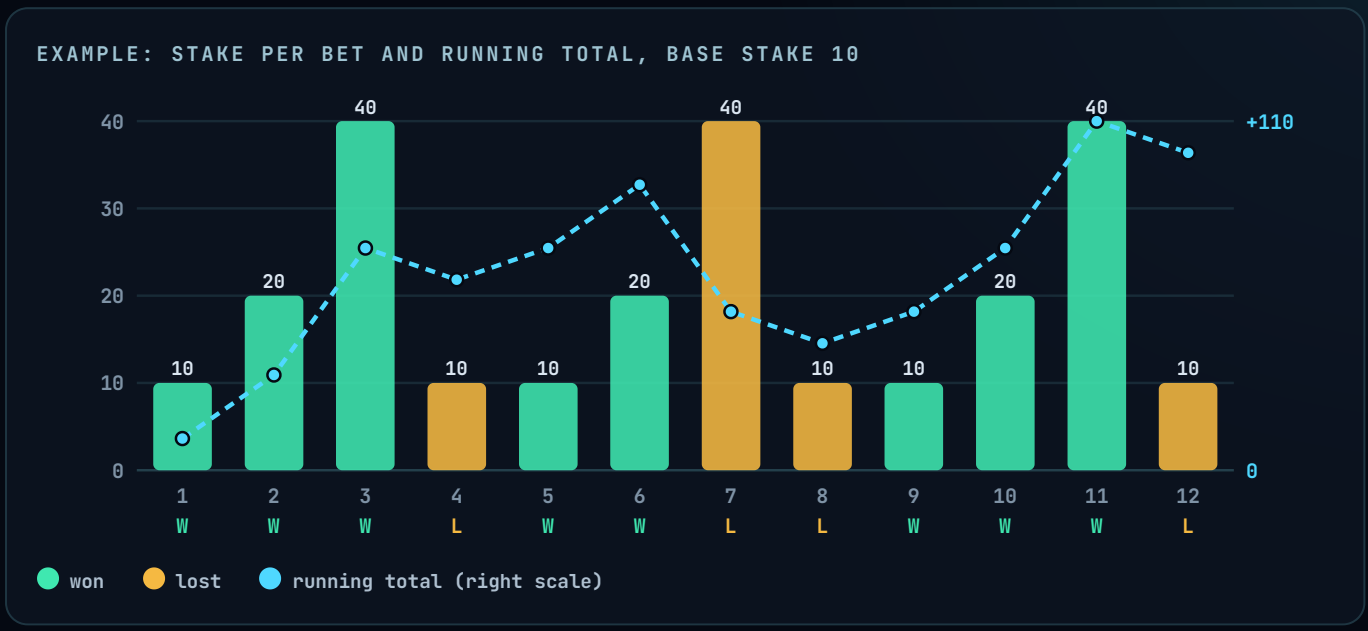

PENGUIN TIP

Paroli does not make wins more likely. It just bundles them: you collect most of the results into rare, bigger hits.

02

EXAMPLE: TWELVE BETS

Twelve bets at odds 2.00 with a base stake of 10: 8 wins and 4 losses. With flat stakes this sequence ends at +40. Paroli ends at **+100**.

#	STAKE		±	TOTAL
1	10	W	+10	+10
2	20	W	+20	+30
3	40	W	+40	+70
4	10	L	-10	+60
5	10	W	+10	+70
6	20	W	+20	+90

#	STAKE		±	TOTAL
7	40	L	-40	+50
8	10	L	-10	+40
9	10	W	+10	+50
10	20	W	+20	+70
11	40	W	+40	+110
12	10	L	-10	+100

Bets 1 to 3 are a full cycle: +10, +20, +40. Bets 5 and 6 win, but bet 7 loses the 40 staked, so the cycle ends at −10, even though two of its three bets won.

That is the price of the system: two wins out of three can still be a losing cycle. Paroli only pays when the third win arrives.

03

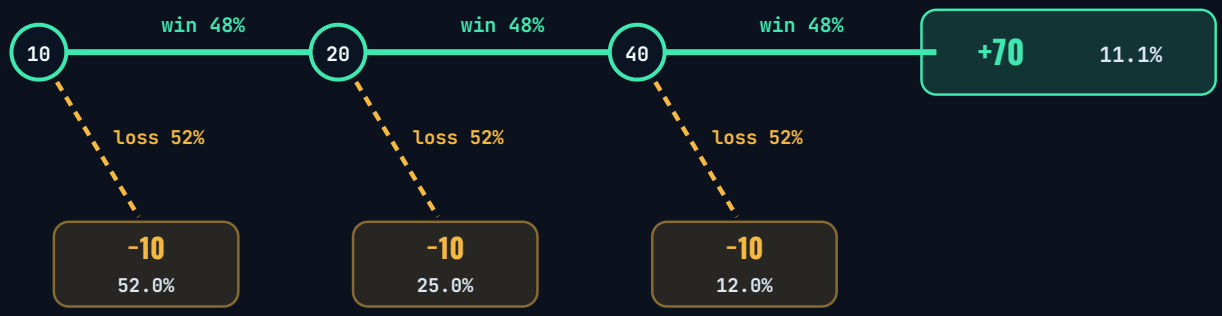

ONE CYCLE, FOUR ENDINGS

Every Paroli cycle ends in one of four ways. Three of them lose exactly one base stake. Only one wins, and it wins seven.

A CYCLE AT ODDS 2.00 AND A 48% CHANCE, BASE STAKE 10

CYCLE	CHANCE	RESULT	STAKED
Loss on bet 1	52.0%	-10	10
Win, then loss	25.0%	-10	30
Two wins, then loss	12.0%	-10	70
Three wins	11.1%	+70	70
Average per cycle	100%	-1.15	28.8

ONE PAROLI CYCLE AS A TREE (ODDS 2.00, CHANCE 48%, BASE STAKE 10)

circles = stake on each bet · boxes = how the cycle ends and how often

The average cycle ends at **−1.15** units. Divided by the average amount staked per cycle, that is −4.0%: the same margin as on a single bet. Paroli redistributes results, it does not create them.

Odds matter even more here than with flat staking: at odds 1.50 a three-win cycle needs a much higher chance, and the payout is much smaller.

WHY PAROLI FEELS BETTER THAN MARTINGALE

Your worst cycle is −10, never −630. That is a real advantage: the risk is capped and predictable. It is a way to control the size of losses, not a way to avoid them.

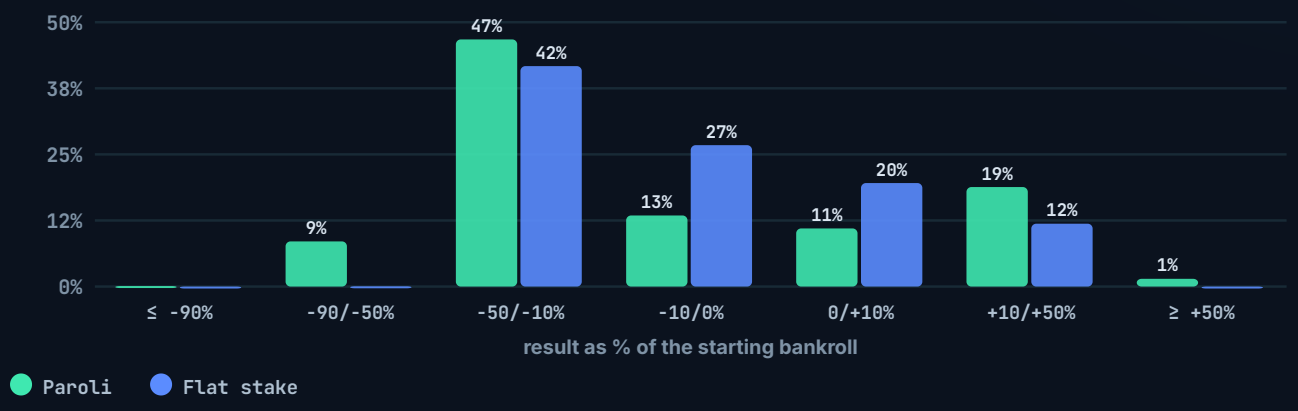

04

10,000 BETTORS, 200 BETS EACH

We simulated **10,000 bettors**. Each starts with 1,000 units and a base stake of 10, then places 200 bets at odds 2.00 where the real chance is 48%. That is about what a 4% margin leaves you. Every bettor got exactly the same results as with a flat stake, so the only difference is the staking. "Bust" means the bankroll fell below one base stake.

30.0%	0.0%	-135	4.0
ENDED IN PROFIT	WENT BUST	AVERAGE RESULT (UNITS)	LOST PER 100 STAKED

WHERE THE BETTORS ENDED AFTER 200 BETS (SHARE OF BETTORS)

	PAROLI	FLAT STAKE
Ended in profit	30.0%	26.9%
Median result	-140	-80
Average result	-135	-79
Went bust	0.0%	0.0%
Largest stake (9 in 10 stayed below)	40	10
Total staked	3,363	2,000
Lost per 100 staked	4.0	4.0

Nobody went bust, because no cycle can lose more than one base stake. But because the stake is often doubled, bettors staked more in total than with flat staking, so the average loss is bigger: the margin works on every unit staked.

The spread is wider in both directions: a few more bettors finish well ahead, and many more finish clearly behind.

05
VERDICT

Of all the progressions in this series, Paroli is the gentlest: it never asks you to stake money you have not already won in the same cycle.

WHAT IT DOES WELL

- + The loss per cycle is capped at one base stake
- + No exploding stakes, no bust in the simulation
- + Simple, with a clear stop after three wins

WHERE IT BREAKS

- − Three wins in a row happen only 11.1% of the time at odds 2.00
- − Two wins out of three can still lose the cycle
- − More staked in total means more lost to the margin
- − Does not change the expected value

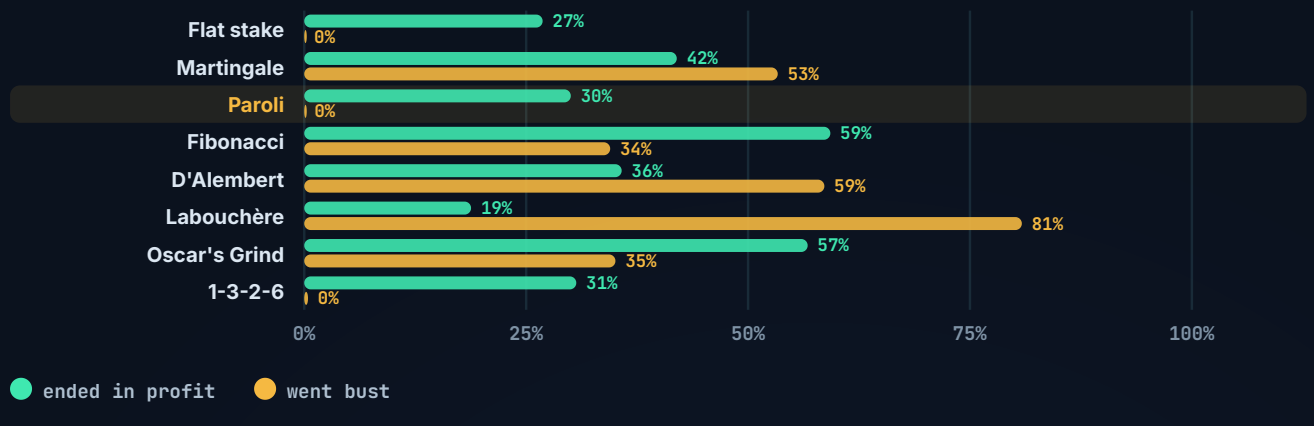

RISK **MODERATE** — nobody went bust, but the average loss was bigger than with flat stakes

IF YOU WANT TO USE IT

- Stick to the three-win stop. Letting a fourth and fifth bet ride turns Paroli into a lottery.
- Use it on odds around 2.00, where the cycle math works as described.
- Check every pick's real chance first: a higher chance per bet matters more than any progression.
- Count the cycles: a losing streak of cycles is normal and expected.
